

Peracto can provide advice and then conduct trials in the field, greenhouse or controlled environment rooms to produce data on efficacy, crop safety and residues that are required for registering products for use in Australia and New Zealand or for product marketing purposes. Data from residue trials, conducted under Good Laboratory Practice (GLP), may be accepted internationally saving valuable time and funds if registering the same product in other countries.

Peracto services include the preparation of project proposals and trial protocols, coordinating the conduct of trials at any location throughout Australia and New Zealand, analysis of research data and preparation of reports and assistance with communication of results to clients or stakeholders.

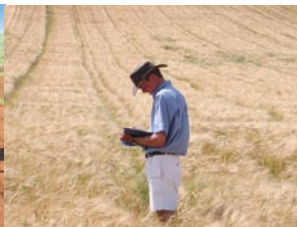

Our controlled environment facilities (greenhouses, tracksprayers, rainfall simulator,) generate data to aid formulation development and support product registration. This can assist selection of formulations for use in field trials and interpretation of results from the field.

Peracto offers:

- Expertise in fungicides, herbicides, insecticides, biological control agents, genetically modified crops, plant growth regulators, fertilizers and soil amendments,
- An appreciation of the requirements of the regulatory authorities for product registrations,
- Excellent networks of growers and agribusinesses throughout Australia and New Zealand providing many trial options and timely trial establishment,
- The option of a single point of contact throughout the project,
- Regular and accurate progress reports,
- Accurate and timely reporting,
- Guaranteed confidentiality.

Peracto is Australasia's leading agricultural research company. We provide independent agricultural research and related services in Australasia for the global market.

Crop protection research using conventional chemistry, biological agents and genetically modified crops is Peracto core business.

With 30 years of experience our multidisciplinary team of professionals offers practical research services in pest, disease and weed management.

Peracto also has proven expertise in the areas of entomology, seed treatment, foliar disease management and in the development of product application equipment and systems.

Peracto has research bases in all Australian states and key regions in New Zealand, ideal for research in a variety of climatic conditions and geographies. This gives us access to a wide range of crops including cereals, canola, pulses, pastures, fruit, vegetables, nuts, sugarcane, cotton, forestry, turf, ornamentals and home garden.
